

interprise suite™

Interprise Suite redefines integration by bringing together entirely different and usually separated business solutions to work seamlessly, bringing efficiency to your business much greater than the sum of their individual capabilities.

Integrated eCommerce Solution

A good example of this synergy is the eCommerce module of Interprise Suite which is a complete website and content management solution.

As you add items, payment terms and shipping methods in Interprise Suite, it will instantly display in your web page with one simple click. Likewise, as customers create their user account from the registration page, it will instantly create a customer record in the Customer Module.

When customers order items from your website and select their preferred shipping methods and payment terms, or use discount coupons, all information will flow into Interprise Suite's order processing and in the back end; completely eliminating the redundancy brought about by reentering, importing and exporting data back and forth.

Integrated CRM

Perhaps the best way to tell Interprise Suite CRM from all others is the integration of communication tools within that are much needed in providing customer service and in dealing with customers and contacts. Interprise Suite CRM includes a full email client and server solution as well as a fully integrated fax solution for your communication and campaign needs.

The presence of CRM tools from anywhere inside the application allows users to spend less time to worrying about how to get record an urgent case or send an email when in a middle of entering a sales order.

Connected Business Platform

The Connected Business Platform brings a whole new way to build and append applications by providing a development platform for creating plugins that would readily integrate with Interprise Suite.

The Connected Business Plugin Factory provides guidance for business solution developers to create plugins for Interprise Suite. The Plugin Manager is then used to register plugins to Interprise Suite and gets it ready for use. Then the User Role menu is used to link or add plugin applications into the application. Plugins may be added as a tab, a form, a custom workflow or dashboard into any module and form in Interprise Suite.

“I need one solution that can do it all”

NO MATTER WHERE YOUR BUSINESS MAY TAKE YOU...

...Interprise Suite has the functionality and scalability
to take you there.

Change is constant in every business environment. The underlying system has to be an aid in making changes change, not an impediment. With challenges and opportunities presenting themselves each new day, the business needs to be able to respond quickly to the new realities.

Designed to adapt to the ever changing needs of businesses, Interprise Suite includes hundreds of features and a reserve of additional features you can acquire as you grow. Have only one warehouse location today? Should you decide to add new warehouses, Interprise Suite can handle your additional warehouses and locations for you.

Interprise Suite is a fully customizable application. By this we mean the application can be made to look and act the way you want, not the other way around. A great number of runtime customizations can be made within Interprise Suite.

Forms can be made to look the way you want.

- Rearrange, group, hide or rename fields
- Enable/disable sections
- Rearrange grid layout
- Group or hide columns
- Rearrange toolbar menus
- Group, rename, or hide menu items

As for modules, you can..

- Add entirely new modules
- Add/remove menus and menu folders
- Enable/disable modules and menus
- Add custom workflow
- Add custom dashboards and
- Modify existing dashboard properties

The data dictionary is a facility provided for implementing system-wide field customizations and security settings. Properties of all existing fields is maintained in this location. New custom fields are easily created herein that can be added to a form with point and click ease.

For extensive customizations, Interprise Suite allows for plug-ins e.g. an application, a form, section in a form, workflow and dashboard to be inserted in the application where you might need it. Powered by the Connected Business Platform, developers are able to quickly and easily create plug-ins

that would readily integrate with Interprise Suite. There is virtually no limit to what you can create. And because each customization is "self contained," it can be reused and kept intact whenever updates becomes available.

Moreover, Interprise Suite's source code, written entirely around Microsoft .NET, is available for developers looking to expand more in developing vertical functionalities to Interprise Suite. As web services become more prevalent in businesses, Interprise Suite is able to take advantage of these new services for additional functionality.

Learn more about the Connected Business Platform and how it can enhance the experience as a user, as a developer or as someone looking into the possibilities of becoming a reseller.

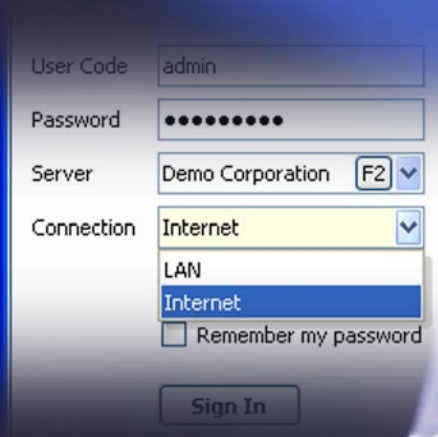

"I need a solution that can keep up with the changes in my business"

“I need a solution that can operate over the internet”

Up until today, companies that have needed a system that can operate and share data over the internet have had to settle for slow browser based applications, expensive leased lines or remote desktop applications in order to work from outside the office. Interprise Suite changes all of that.

Built around advanced Microsoft .NET “web service” technology, Interprise Suite combines the ability to work over the Internet with the rich user interface and superior performance of a traditional desktop application. The result is a program that gives your organization the power to operate without boundaries, giving remote users and offices the ability to work together as if they were located in the main office.

Interprise Suite represents a new breed of application that can combine the connectability of a browser based system with the speed and usability of a traditional desktop application.

The screenshot shows a login window with the following fields and options:

- User Code: admin
- Password: masked with 10 dots
- Server: Demo Corporation (F2) [dropdown arrow]
- Connection: Internet [dropdown arrow]
- LAN [dropdown arrow]
- Internet [dropdown arrow]
- Remember my password
- Sign In button

“I need a solution that gives me quick access to the information I want”

Access to the right information is critical when making business decisions in today's information age. Now, technology allows us to gather important data that we need wherever and whenever we want. But the quest to better service doesn't end just because the information can be harnessed or not. Now, speed is the challenge: the faster the better, because in the business world, time means money.

Interprise Suite features data compression which allows the application to compress XML data for streaming over the internet, reducing the file size and the bandwidth usage, therefore increasing the speed of transfers altogether. Once the data is transferred into the database or the user end, it is decompressed to original form and ready for operation. This process does not only make transfer significantly quicker but also safeguards information as it runs over the internet. The lighter data that needs to travel back and forth means better scalability for your system.

Interprise Suite is the best solution for companies that are looking for a solution that can not only meet the demands of your organization today, but also the demands of your organization tomorrow. Not only is Interprise Suite built on powerful Microsoft SQL Client / Server technology (which runs the largest windows database in the world), but is also written using the new Microsoft .NET platform - the platform of the next generation of windows. As your company grows with more users and the world changes with new technology, Interprise Suite is ready.

Technology Spotlight

Although Interprise Suite is the most affordable solution of its kind, its technology actually surpasses many of the most expensive solutions available. The more you understand about the technological infrastructure of Interprise Suite and its application the more you will understand how truly powerful it is.

Important Questions to Ask...

Many popular Accounting / ERP solutions are based on older outdated technology that is quickly becoming obsolete. In order to protect your investment in a new system it is important that you ask the right questions.

Is the system built on SQL Client / Server Technology? If so what SQL technology is used?

If the system is not client /server then it will not grow with your company. Also be cautious of systems that use older SQL databases.

Is the system built on Microsoft .NET technology?

.NET becomes the standard platform with the next version of Windows. Non .NET applications will be phased out and will run in "compatibility mode" like DOS programs do today.

Is the application a native XML application? Does it include any web services?

XML and Web Services are new technologies that promises to completely change the way business is transacted. Many of the most popular Accounting / ERP systems on the market today are being "re-written" to become native XML applications. Interprise Suite is a native XML application that includes XML web services.

How are customizations done? Is the source code available? If I customize the source code, can I upgrade to new versions?

As your company grows the ability to modify the application may be come necessary. Find out if the source code of the application is available and how the application handles upgrading modified source code. Interprise Suite is written using Visual Basic .NET – one of the most widely used development platforms.

- Built using the Microsoft .NET Platform
- Microsoft SQL Client / Server Technology
- XML Web Services Connected
- Extendable Architecture (Keep customizations)
- 2 or 3 Tier Installation (Increased Scalability)
- Data Compression speeds data access
- Field level security and concurrency
- Self updating for lower admin costs

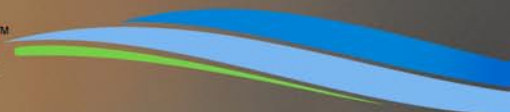

“I need a solution that can grow
with our company”

“I need a solution that can connect my trading partners electronically”

Having connectivity as one of its most substantial benefits, being able to work over the internet without a browser, therefore, leaving windows based and web based applications way behind the curve. Built from smart client and XML web service technology, Interprise Suite...

- Connects to your company data through local area network or over the Internet via XML web service
- Combines the best aspects of desktop and browser based applications: Internet enables, LAN comparable performance, rich user interface

“I need a solution that I can customize...”

Interprise Suite supports different levels of customization for the greatest degree of flexibility.

Form layout customization can be done in practically any form in Interprise Suite. Modifying existing field properties, adding new custom fields and adding new tables are done entirely in the Data Dictionary. The Data Dictionary works with the user role for field level security.

The User Role menu is responsible for applying user role based restrictions throughout the application. As an administrator, one can create user roles and select which modules and menus employees would use exclusively for the tasks given to them.

Interprise Suite extends in its functionalities via its unique plugin architecture. With the Connected Business Platform, developers are able to quickly and easily develop applications that could add vertical functions to Interprise Suite.

Interprise Suite was also designed with an “extendable architecture” that separates customization code from the application code. This allows you to update your system at anytime with a good probability that your customizations will not be affected. As new customizations are added to the application, the help file is even updated based on your new customizations.

“...and upgrade without losing those customizations.”

“I need a solution that is affordable”

You have probably noticed that when shopping for an Accounting / ERP solution that prices are never quoted until you give up quite a bit of information about your company. This allows the salesperson to “size up” your organization and make a determination of how much your organization can afford to pay for their application. Imagine if you applied that practice to your business.

Priced competitively with off the shelf applications such as QuickBooks and Peachtree, Interprise Suite represents an unmatched value in enterprise level software. Flexible licensing options make it as easy to buy as it is to use.

Subscription Based Licensing Available

Subscribe to Interprise Suite for a low monthly fee and eliminate the up front costs associated with Accounting / ERP solutions. Just sign up online and download the Interprise Suite client and you're ready to start!

Multi-user Licensing Available

Our multi-user option allows companies to purchase additional user blocks for a very affordable price. Interprise Suite is sold as a complete application and pricing is published for the whole. No hidden charges nor fees.
